

## Orbital Hybridization

Okay, you know the atomic picture of electronic structure around the nucleus (spdf, etc.), and you know how to draw Lewis diagrams that represent covalent bonds between atoms in the molecules. You can also get basic geometries from VSEPR. Now, the problem is that atomic orbitals and VSEPR contradict one another, and this is where orbital hybridization comes in.

For example look at methane CH<sub>4</sub>

### We know the Lewis picture

### We know about atomic carbon's valence shell

So the quandary is how do you get four symmetric covalent bonds from these s and p atomic orbitals. VB Theory says to mix together the atomic orbitals and come out with four symmetric molecular orbitals.

For any bonded atom, the No. of hybrid orbitals = the # of  $\sigma$  bonds + the # of nonbonding pairs  
The No. of hybrid orbitals = No. of molecular orbitals you combine to form them.

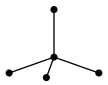

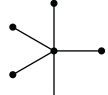

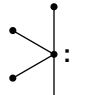

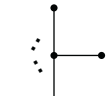

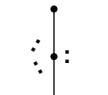

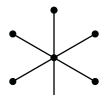

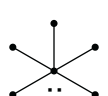

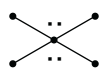

No. of hybrid orbitals required	Atomic orbital soup	Hybrid name	Base geometry that results
2	s+p	sp	linear
3	s+p+p	sp <sup>2</sup>	trigonal planar
4	s+p+p+p	sp <sup>3</sup>	tetrahedral
5	s+p+p+p+d	sp <sup>3</sup> d	trigonal bipyramidal
6	s+p+p+p+d+d	sp <sup>3</sup> d <sup>2</sup>	octahedral

### Hybrid vs. atomic orbitals in bonding

**Bonds formed by hybrid orbitals are always internuclear sigma ( $\sigma$ ) bonds.**

**Pi ( $\pi$ ) bonds (which are not on the path between nuclei) are formed by the overlap of atomic p-orbitals.**

## Molecules: Valence Bond Theory: Student Review Notes

Hybridization	# of $\sigma$ Bonds	# of Non-Bonding Pairs	Molecular Shape	Bond Angles	Example
sp	2	0	 Linear	180°	BeH <sub>2</sub> , CO <sub>2</sub>
sp <sup>2</sup>	3	0	 Trigonal planar	120°	SO <sub>3</sub> , BF <sub>3</sub>
sp <sup>2</sup>	2	1	 Angular	<120°	SO <sub>2</sub> , O <sub>3</sub>
sp <sup>3</sup>	4	0	 Tetrahedral	109.5°	CH <sub>4</sub> , CF <sub>4</sub> , SO <sub>4</sub> <sup>2-</sup>
sp <sup>3</sup>	3	1	 Trigonal pyramidal	<109.5°	NH <sub>3</sub> , PF <sub>3</sub> , AsCl <sub>3</sub>
sp <sup>3</sup>	2	2	 Angular	<109.5°H	H <sub>2</sub> O, H <sub>2</sub> S, SF <sub>2</sub>
sp <sup>3</sup> d	5	0	 Trigonal bipyramidal	120°, 90°	PF <sub>5</sub> , PCl <sub>5</sub> , AsF <sub>5</sub>
sp <sup>3</sup> d	4	1	 Seesaw (irregular tetrahedron)	<120°, <90°	SF <sub>4</sub>
sp <sup>3</sup> d	3	2	 T-shaped	<90°	ClF <sub>3</sub>
sp <sup>3</sup> d	2	3	 Linear	180°	XeF <sub>2</sub> , I <sub>3</sub> <sup>-</sup> , IF <sub>2</sub>
sp <sup>3</sup> d <sup>2</sup>	6	0	 Octahedron	90°	SF <sub>6</sub> , PF <sub>6</sub> <sup>-</sup> , SiF <sub>6</sub> <sup>2-</sup>
sp <sup>3</sup> d <sup>2</sup>	5	1	 Square pyramidal	<90°	IF <sub>5</sub> , BrF <sub>5</sub>
sp <sup>3</sup> d <sup>2</sup>	4	2	 Square planar	90°	XeF <sub>4</sub> , IF <sub>4</sub> <sup>-</sup>
